Electric Vehicle Infrastructure in Massachusetts
Diego Adrianzén (ECE), Kristin Darby (CHE), Hannah McCallum (AE)
Advisor: Professor Kent Rissmiller (Social Sciences)

Project Goal:
To create a set of recommendations for how the state of Massachusetts can develop adequate infrastructure to support electric vehicles.

Conclusions/Recommendations
- Massachusetts will need 12,000-15,000 public charging stations or battery switching stations installed in order to support 8,000-10,000 electric vehicles that are predicted to be on the road in Massachusetts by the year 2020.
- Public stations should be installed in areas such as commuter rail/MBTA parking lots, shopping malls, and major businesses.
- The state should look into joining Project Get Ready and Charge Point America to receive educated assistance for building infrastructure.
- Massachusetts should keep the tax incentives for EVs in place until battery technology technology improves significantly or until the cost of EVs is equivalent to a gas powered vehicle.

Survey Results
If there were a significant increase in electric vehicle infrastructure, I would look into purchasing an electric vehicle

Methods/Process
- Surveyed 554 people from WPI and across the country.
- Analyzed the market trends of PHEVs and extrapolated the findings to estimate the predicted number of EVs on the road by 2020.
- Interviewed Linda Benevides (EOEEA) to find out what is currently happening in MA. in terms of building EV infrastructure.
- Compared and contrasted Gas Stations to Charging Stations to Battery Switching Stations.

Background
- EVs are the future green cars due to the problems with ethanol and hydrogen.
- Installing battery switching stations and charging stations is cheaper than installing gas stations.
- New methods for funding the Highway Fund need to be created.
- The federal government provides a $7500 tax credit on PHEVs and EVs.
- Charging stations, battery switching stations already exist, and General Electric is installing 600,000 by the year 2015.
- Other countries and regions of the world are switching over to EVs, including Israel, Denmark, and Australia.

Summary
- Electric vehicles will significantly penetrate the market unless there is a supporting infrastructure.
- The impact the proposal may have is that people will switch from gasoline-fueled cars to electric vehicles.
- Research involved obtaining public opinion, analyzing market trends, an interview with a state official, and comparing data on gas stations, charging stations and battery switching stations.
- Between 8,000 and 10,000 EVs will be on the road by the year 2020 in Massachusetts, and that in order to support that many vehicles, there needs to be 12,000-15,000 public electric vehicle refueling stations in the form of charging stations or battery switching stations.
- Battery switching stations and charging stations will be successful in metropolitan areas. These stations will reduce the "range anxiety" most people worry about when buying an electric car.

Acknowledgments
We would like to thank Linda Benevides for providing us with valuable information.
Sincerely- Diego, Hannah, Kristin.
